Xamarin Evolve 2014

“A software system designed to support interoperable machine-to-machine interaction over a network.”

W3C - <http://www.w3.org/TR/ws-arch/>  
Wikipedia: [https://en.wikipedia.org/wiki/Web\\_service](https://en.wikipedia.org/wiki/Web_service)

## Common Characteristics

- Language agnostic
- Supported over HTTP
- Exposes an API to clients
- Discoverable

# Why web services?

Xamarin University

## Distributed Computing

- Utilize 3<sup>rd</sup> party services
- Securely access data from our mobile apps
- It's a big, big world and user's expect our apps to connect to other apps and services they use

## Watching Connectivity

- Monitor network connections
- Detect network type
- Host reachability

# SOAP and RESTful services

Xamarin University

## SOAP

- Highly structured
- XML based
- WSDL
- Multiple protocols

Xamarin University

# Demo

## SOAP – Request

```
POST /InStock HTTP/1.1
Host: www.example.org
Content-Type: application/soap+xml; charset=utf-8
Content-Length: 299
SOAPAction: "http://www.w3.org/2003/05/soap-envelope"

<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Header>
  </soap:Header>
  <soap:Body>
    <s:GetStockPrice xmlns:s="http://www.example.org/stock">
      <s:StockName>IBM</s:StockName>
    </s:GetStockPrice>
  </soap:Body>
</soap:Envelope>
```

Xamarin University

## SOAP – Response

```
HTTP/1.1 200 OK
Content-Type: application/soap+xml; charset=utf-8
Content-Length: 201

<?xml version="1.0"?>
<env:Envelope xmlns:env="http://www.w3.org/2003/05/soap-envelope"
  xmlns:s="http://www.example.org/stock">
  <env:Body>
    <s:GetStockPriceResponse>
      <s:StockPrice>45.25</s:StockPrice>
    </s:GetStockPriceResponse>
  </env:Body>
</env:Envelope>
```

Xamarin University

## SOAP – Generated Proxy

```
public double GetStockPrice(string stockName)
{
    // Invocation of the service method
}
```

Xamarin University

## Using SOAP from an App

- Server typically uses a framework, like WCF
- Tools to create a *proxy file*
- App uses the proxy methods to create, send and receive the XML data

## SOAP – Pros and Cons

- |   |   |
|---|---|
| <ul style="list-style-type: none"><li>+ Platform and Language agnostic</li><li>+ Additional specifications for standardized security, etc.</li><li>+ Supports different transports</li><li>+ Easy to setup and to use</li></ul> | <ul style="list-style-type: none"><li>– Verbose payload</li><li>– Proxy files hard to maintain and can be brittle to change</li><li>– Not cacheable</li></ul> |

## RESTful Services

- Representational State Transfer
- Simple XML over HTTP at its core
- Uses the standard HTTP verbs

## REST – Request

<http://www.example.org/stock/IBM>

```
GET /stock/IBM HTTP/1.1  
Host: example.org  
Accept: text/xml  
Accept-Charset: utf-8
```

Xamarin University

## REST – XML Response

```
HTTP/1.1 200 OK
Content-Type: text/xml; charset=utf-8
Content-Length: 100

<?xml version="1.0"?>
<s:Quote xmlns:s="http://example.org/stock">
    <s:StockPrice>45.25</s:StockPrice>
</s:Quote>
```

Xamarin University

## REST – JSON Response

```
HTTP/1.1 200 OK
Content-Type: text/json; charset=utf-8
Content-Length: 30

{
    "StockPrice" : 45.25
}
```

Xamarin University

## REST – Pros and Cons

- |  |   |
|--|---|
| <ul style="list-style-type: none"><li>+ Accessible to any client that supports HTTP</li><li>+ Supports caching</li><li>+ Concise, closer to the web – uses HTTP verbs and response codes</li><li>+ No tooling required</li></ul> | <ul style="list-style-type: none"><li>– HTTP(s) only</li><li>– No official standards</li><li>– Harder to map results to objects</li></ul> |
|--|---|

## Summary

- Web services are easy to consume in mobile apps
- There is no good or bad
- Add an abstraction layer
